CZ/SK // FIELD INTELLIGENCE

MINECRAFT TREND RADAR_

Catch the format before the market catches up.

Czechia + Slovakia | Minecraft server formats | Hosting product research

DEMO / SYNTHETIC DATA

Collected: 2026-11-07T16:40:26+00:00
Run: demo-d4225208a1b24e86
Report language: English

Evidence first. Uncertainty visible. No automatic purchases, deployments or claims of guaranteed demand.

Every metric in this report is a synthetic fixture for testing the tool and layout. Do not use these rankings as market research.

01 / Decision board

3 formats pass the pilot gate. Start with a small, reversible validation campaign; the score is a research heuristic, not a success probability.

FORMAT	SCORE / 100	CONFIDENCE	DECISION
Lifesteal SMP	62.9	100% coverage	PILOT CANDIDATE
Cobblemon / creature collecting	62.3	100% coverage	PILOT CANDIDATE
Create / factory co-op	48.3	95% coverage	PILOT CANDIDATE
One-life / event hardcore	24.4	95% coverage	ESTABLISHED / CROWDED
RPG / questing worlds	23.7	95% coverage	ESTABLISHED / CROWDED
Cozy / Vanilla+ co-op	16.8	95% coverage	ESTABLISHED / CROWDED
Civilization / social experiments	15.8	95% coverage	ESTABLISHED / CROWDED
SkyBlock / OneBlock co-op	12.7	95% coverage	ESTABLISHED / CROWDED
Horror / survival events	10.5	95% coverage	ESTABLISHED / CROWDED
Crossplay / social economy	6.9	95% coverage	ESTABLISHED / CROWDED

Confidence is an evidence-coverage heuristic, not a statistical confidence interval. Recommendations are not estimates of player population.

02 / Collection health

SOURCE	STATE / ITEMS	DETAILS
youtube	demo / 16	SYNTHETIC fixture, not live platform data
google_trends	demo / 30	SYNTHETIC fixture, not live platform data
modrinth	demo / 10	SYNTHETIC fixture, not live platform data
reddit	demo / 30	SYNTHETIC fixture, not live platform data
server_lists	demo / 10	SYNTHETIC fixture, not live platform data
reports	demo / 0	SYNTHETIC fixture, not live platform data

TikTok / Facebook: authorized RSS or CSV imports only. No private-group access is implied. Discord requires an authorized bot and configured channels. YouTube's official API requires a key; its public fallback is less complete.

03 / Why the ranking works

The radar looks for convergence: mid-size creators adopting a format, sustained local search momentum, repeat hosting-intent questions, and measured ecosystem growth. It discounts sampled supply saturation and isolated search spikes. General trend reports are lagging context and receive zero score.

SIGNAL	WEIGHT	MEASUREMENT
Creators	25%	Dated videos; views/subscribers breakout at 50k-500k subscribers; independent channels and local language signals.
Local search	30%	12-month CZ/SK weekly series; recent four weeks vs prior four; eight-week slope, low-volume and spike checks. US is a small corroborating signal.
Mod ecosystem	15%	Same-project download-counter change over >=24h; one snapshot gets only limited popularity points.
Community intent	20%	Unique, dated hosting/setup questions and recent-vs-prior 14-day counts.
Server adoption	10%	Positive tag-count change in comparable local first-page samples; no points for unobserved supply.

Formula: raw = sum(signal x weight). Score = max(0, raw - supply penalty - spike penalty) x (0.45 + 0.55 x coverage/100). Supply penalty is capped at 18; isolated local spikes add 8. Missing signals get no points; weights are never redistributed.

Pilot gate: score >=45, coverage >=60, at least three signal families, a temporal signal and local demand (sustained CZ/SK search, >=2 local hosting questions, or >=2 local creator channels). Coverage uses source-family breadth (12 points/family), local observations (up to 20), temporal evidence (12), and both local search markets (8).

An English-to-CZ/SK lag is reported only when both search series have detectable, maintained take-off points. Relative indices cannot establish market-size differences. Modpack discovery is automatic, but a newly popular project starts as a hypothesis.

04.1 / Lifesteal SMP

PILOT CANDIDATE | score 62.9/100 | coverage 100% | local items 8

CREATORS	■■■■■■■■■■■■■■■■■■■■■■■■■	100/100
SEARCH	■■■■■■□□□□□□□□□□□□□□□□□□□	27/100
MODS	■■■■■■■■■■■■■■■■■■■■■□□□□	79/100
COMMUNITY	■■■■■■■■■■■■■■■■■■■■■■□□□	84/100
SERVERS	■■■■■□□□□□□□□□□□□□□□□□□□□	20/100

Evidence and demand mechanism

+ 3 dated creator items across 3 channels; 3 mid-size view/subscriber breakouts.

+ CZ search: +20.9% recent four weeks vs prior four; sustained climb.

+ SK search: +20.9% recent four weeks vs prior four; sustained climb.

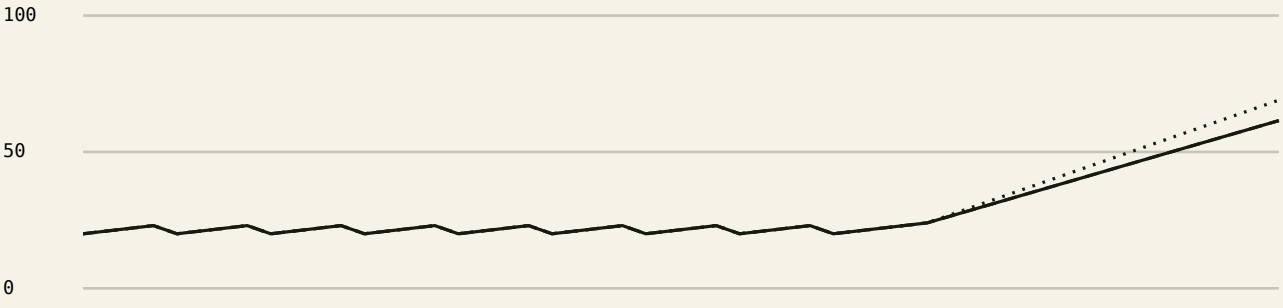

+ Observed search take-off lag: about 1.0 weeks (heuristic, not a forecast).

+ Observed modpack download velocity: 4,000.0/day across 1 matched projects.

+ 7 unique hosting-intent discussions; 7 in the last 14 days vs 0 in the prior 14.

+ Matched 2/100 sampled local listings (2.0%); sample, not market share.

Search momentum / complete observations

Relative 0-100 index; not absolute volume or cross-country size.

Why it could work for a local host

Hypothesis: reduce the gap between watching a creator format and playing it with friends. A pinned server template, matching client instructions, Czech/Slovak onboarding and measured restore support can remove setup friction. This mechanism must be validated with signups and paid pilots; a popular video alone does not prove purchase intent.

05.1 / Build the hosting offer

Lifesteal SMP // Paper + a licensed Lifesteal plugin

1. Pin Paper and plugin versions; configure heart limits and combat logging.

2. Offer a whitelisted friend-group preset and a separate public PvP preset.

3. Test death, revive, anti-dupe, permissions, grief protection and backups.

Template acceptance checklist

Pin Minecraft, loader, plugins/mods and Java versions. Verify upstream distribution rights. Keep credentials out of the image. Define storage and world-border limits. Test first boot, whitelist, reconnect, death/respawn, a scheduled backup and restore to a new instance. Record actual deployment time before advertising '2 minutes'.

Capacity and tariff model / assumptions, not measured capacity

INPUT / OUTPUT	ILLUSTRATIVE VALUE
Starting RAM budget (load-test before sale)	4 GB
Proposed monthly price	12.00 EUR
RAM + CPU/storage + support + payment costs	7.26 EUR/month
Contribution before tax, acquisition and overhead	4.74 EUR (39.5%)

Inputs: RAM 0.65 EUR/GB; CPU/storage 2.0/month; support 10.0 min/month at 12.0/hour; payment 3.0% + 0.3. Excludes VAT, licensing, bandwidth overages, marketing and fixed overhead. Edit config for your real costs.

Capacity experiment

Start at 4 GB as a budget hypothesis. Benchmark with 6-10 actual players, exploration, busy bases and backup/restore. Target p95 tick duration <50 ms, no sustained swapping, and <80% RAM utilization. Increase price or reduce pack complexity if contribution is negative; never promise slots from RAM alone.

Risks: PvP churn and toxicity; Plugin license and economy exploits

06.1 / Audit + launch experiment

Lifesteal SMP

What could falsify the thesis

- Creator breakout uses views/subscribers, not a channel's usual view baseline; views are not buyer counts.
- Community collection is a recent-post sample; repeated questions indicate intent, not total market size.

COMMUNITY	■■■■■■■■■■■■■■■■■■■■■■■	84/100
SERVERS	■■■■■	20/100

Evidence and demand mechanism

+ 3 dated creator items across 3 channels; 3 mid-size view/subscriber breakouts.

+ CZ search: +19.8% recent four weeks vs prior four; sustained climb.

+ SK search: +19.8% recent four weeks vs prior four; sustained climb.

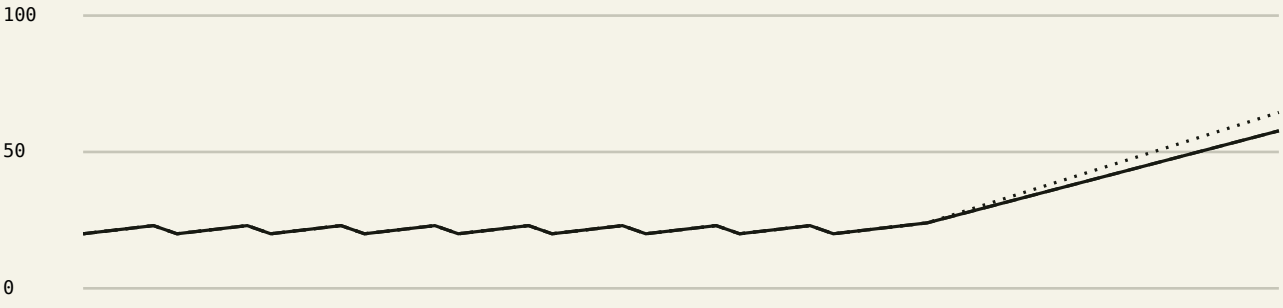

+ Observed search take-off lag: about 1.0 weeks (heuristic, not a forecast).

+ Observed modpack download velocity: 3,600.0/day across 1 matched projects.

+ 7 unique hosting-intent discussions; 7 in the last 14 days vs 0 in the prior 14.

+ Matched 2/100 sampled local listings (2.0%); sample, not market share.

Search momentum / complete observations

Relative 0-100 index; not absolute volume or cross-country size.

Why it could work for a local host

Hypothesis: reduce the gap between watching a creator format and playing it with friends. A pinned server template, matching client instructions, Czech/Slovak onboarding and measured restore support can remove setup friction. This mechanism must be validated with signups and paid pilots; a popular video alone does not prove purchase intent.

05.2 / Build the hosting offer

Cobblemon / creature collecting // Fabric or NeoForge + an explicitly licensed server modpack

1. Select one server-compatible pack and pin its loader, Minecraft and mod versions.

2. Generate a matching client manifest; pre-generate a bounded world.

3. Test battles, trades, persistence, spawn rules and a restore with 6-10 players.

Template acceptance checklist

Pin Minecraft, loader, plugins/mods and Java versions. Verify upstream distribution rights. Keep credentials out of the image. Define storage and world-border limits. Test first boot, whitelist, reconnect, death/respawn, a scheduled backup and restore to a new instance. Record actual deployment time before advertising '2 minutes'.

Capacity and tariff model / assumptions, not measured capacity

INPUT / OUTPUT	ILLUSTRATIVE VALUE
Starting RAM budget (load-test before sale)	8 GB
Proposed monthly price	12.00 EUR
RAM + CPU/storage + support + payment costs	9.86 EUR/month
Contribution before tax, acquisition and overhead	2.14 EUR (17.8%)

Inputs: RAM 0.65 EUR/GB; CPU/storage 2.0/month; support 10.0 min/month at 12.0/hour; payment 3.0% + 0.3. Excludes VAT, licensing, bandwidth overages, marketing and fixed overhead. Edit config for your real costs.

Capacity experiment

Start at 8 GB as a budget hypothesis. Benchmark with 6-10 actual players, exploration, busy bases and backup/restore. Target p95 tick duration <50 ms, no sustained swapping, and <80% RAM utilization. Increase price or reduce pack complexity if contribution is negative; never promise slots from RAM alone.

Risks: Pack redistribution and third-party IP; CPU load during exploration; Client install friction

06.2 / Audit + launch experiment

Cobblemon / creature collecting

What could falsify the thesis

- Creator breakout uses views/subscribers, not a channel's usual view baseline; views are not buyer counts.
- Community collection is a recent-post sample; repeated questions indicate intent, not total market size.

CZ: Vase parta, vlastni RPG svet. Pripravene questy i server.

SK: Vasa partia, vlastny RPG svet. Pripravene questy aj server.

Demo the actual install and client join. Invite one small creator and 5-10 friend groups. Measure installs, time-to-first-join, seven-day return, support time and paid conversion; do not buy a large fleet before this pilot.

07 / 14-day validation sprint

WHEN	ACTION	DECISION RULE (PROPOSED TARGET)
Days 1-2	Repeat scans; audit source pages and choose one format with local temporal evidence.	No local evidence: continue research, do not call it a launch.
Days 3-5	Build a private template; validate license, Java/loader, first join and restore.	No severe data-loss/security defects; restore within 15 minutes.
Days 6-9	Recruit 5-10 CZ/SK friend groups and a small creator. Publish two localized setup demos.	Track actual installation completion and support minutes per group.
Days 10-14	Review paid conversion, day-seven retention and unit economics.	Example gate: >=5 paying groups, >=50% day-seven group return, positive contribution. Adapt to your baseline.
Stop / revise	Kill the offer if onboarding fails, search collapses, license blocks redistribution, or support erases margin.	Record the rejection reason; retain data for the next scan.

Automation and monitoring

Schedule one live scan per day with Windows Task Scheduler. SQLite stores append-only live snapshots. Modpack and server-tag velocity requires >=24h between comparable snapshots. Keep a two-week observation window before interpreting acceleration. Review source failures and sample drift on every report.

Additional dimensions

Check seasonality (holidays and school terms), licensing, crossplay demand, install friction, player age/moderation needs, creator dependence, CPU cost, retention, and competitive positioning. These are validation tasks, not automatically measured facts. A sustainable niche may beat a high-view, high-churn event format.

08 / Optional local AI notes

Deterministic evidence-based report; local AI is optional.

The deterministic ranking and report work without AI. A 3B Q4 model via Ollama is a sensible starting point for a 4 GB VRAM GPU with a 2k-token context; actual VRAM depends on backend and GPU and may spill to system RAM. Model output cannot create evidence, change scores or authorize deployments. Laya or another model can be selected if installed in Ollama; compatibility is not assumed.

09 / Evidence ledger

Links are original source citations. Timestamp, metric, raw series and all observations are in report.json. Private-community citations require your existing access. The PDF includes selected anchors; the JSON ledger contains every observation. Synthetic demo links use example.com.

Reproducibility

Artifacts: report.pdf, report.json, observations.csv. Config snapshots omit credentials; credentials are read only from process environment. No private messages or usernames from Discord are persisted. Retain artifacts securely if authorized community sources are enabled.
